This document is written to explain the main functions of **pbdZMQ** (Chen and Schmidt 2015), version 0.1-0. Every effort will be made to ensure future versions are consistent with these instructions, but features in later versions may not be explained in this document.

Information about the functionality of this package, and any changes in future versions can be found on website: "Programming with Big Data in R" at http://r-pbd.org/ (Ostrouchov et al. 2012).

1. Introduction

ZeroMQ (ØMQ) at http://www.zeromq.org/ is a library for high-performance asynchronous messaging in scalable distributed applications. It provides APIs in several messaging patterns that essentially the basic way to form connections between devices including computers, mobile devices, and of course supercomputers. The APIs also simplify the complex calls to sockets and reduce the burden of knowing network communications. Several popular programming languages have also provided biding to utilize and take advantage from those APIs.

In **pbdZMQ**, those ZeroMQ APIs are in detail manners wrapped in R via lower level C language. **pbdZMQ** mainly implements on a few ZeroMQ patterns including

- request-reply, in particular, one client and a server, and
- push-pull, in particular, one client and a set of servers.

These patterns are useful communication frameworks designed in **pbdCS** (Schmidt and Chen 2015) that combines two different messaging libraries ZeroMQ and MPI and utilizes their advantages in

- interaction of user interface by ZeroMQ or **pbdZMQ**, and
- computation of statistical programming by MPI or **pbdMPI** (Chen et al. 2012).

2. Installation

There are three ways to install **pbdZMQ**

- 1. with system libzmq and libzmq-dev packages (as pkg-config is available),
- 2. with internal ZeroMQ library (4.1.0 rc1), or
- 3. with external ZeroMQ library (newer version).

The first way is easiest when a package managing system is available and produces both

• pkg-config -variable=includedir libzmq and

• pkg-config -variable=libsdir libzmq.

The second way is tested under Linux, Mac OSX, and Windows systems, while the third way is only tested under Linux system. Solaris has been tested without any success in neither ways. FreeBSD is not tested yet.

Installation with system libzmq and libzmq-dev packages: it can be simply done with

Shell Command

```
R CMD INSTALL pbdZMQ_0.1-0.tar.gz
```

Installation with internal ZeroMQ library: it can be simply done with

Shell Command

```
R CMD INSTALL pbdZMQ_0.1-0.tar.gz \
--configure-args="--enable-internal-zmq"
```

Example steps for installing with external ZeroMQ library:

• The minimum steps for installing zeromq-4.1.2.tar.gz is

Shell Command

```
./configure \
    --prefix=/usr/local/zmq \
    --enable-shared=yes \
    --with-poller=select \
    --without-documentation \
    --without-libsodium
make -j 4
make install
```

which will install the library to /usr/local/zmq/ where /usr/local/zmq/include/ will have the header file zmq.h and /usr/local/zmq/lib/ will have the shared library file libzmq.so.

• Therefore, we can install **pbdZMQ** as next:

Shell Command

```
R CMD INSTALL pbdZMQ_0.1-0.tar.gz \
--configure-vars="ZMQ_INCLUDE='-I/usr/local/zmq/include' \
ZMQ_LDFLAGS='-L/usr/local/zmq/lib -lzmq'"
```

Suppose **pbdZMQ** is installed correctly. One may run the next from *one* terminal to test the library.

Shell Command

```
Rscript -e "demo(hwserver, 'pbdZMQ', ask=F, echo=F)" & Rscript -e "demo(hwclient, 'pbdZMQ', ask=F, echo=F)"
```

This will run 5 iterations to send and receive 5 times of 'Hello World' messages between two instances (simple server and client).

Note that one may want to use different polling system provided by ZeroMQ library. By default select method is used in **pbdZMQ** for Linux, Windows, and Mac OSX. However, users may want to use autodetect or try others for better polling. Currently, the options as given by ZeroMQ may be kqueue, epoll, devpoll, poll, or select depending on libraries and system. The next may be used to change the polling method:

Shell Command

```
R CMD INSTALL pbdZMQ_0.1-0.tar.gz \
--configure-vars="ZMQ_POLLER='autodetect'"
```

3. Examples

The package provides simplest examples based on the ZeroMQ guide for C developers by Pieter Hintjens (Hintjens 2013). The source codes next are all in the pbdZMQ/demo/directory, such as

Examples	Descriptions
hwclient.r	hello world client
hwserver.r	hello world server
tasksink.r	task sink from two workers
taskvent.r	task ventilator send jobs to two workers
taskwork.r	task workers
wuclient.r	weather updating client
wuserver.r	weather updating server

For example, the task examples can be run by

Shell Command

```
Rscript taskwork.r &
Rscript taskvent.r
Rscript tasksink.r

### Remember to kill two worker processors at the end, such as
ps -x|grep "file=task.*\.r"|sed "s/\((.*\)) pts.*/\1/"|xargs kill -9
```

Or, via demo() function as the hello world example in Section 2.

The weather updating examples can be run by

Shell Command

```
Rscript wuserver.r &
Rscript wuclient.r
rm weather.ipc
```

Or, via demo() function as the hello world example in Section 2.

4. Backward Comparable with rzmq

The package currently has a few wrapper functions to server as the same functions in **rzmq** (Armstrong 2014). The original intension is only for backward comparable but without 100% fully functional guarantee. Users are recommended to use native **zmq.*()** functions provided by **pbdZMQ**.

The wrapper functions are listed in next

Functions
send.socket()
receive.socket()
init.context()
init.socket()
bind.socket()
connect.socket()
